

VARIABILITY SIGNATURES OF THE HADRONIC MODEL

A. Mastichiadis
University of Athens

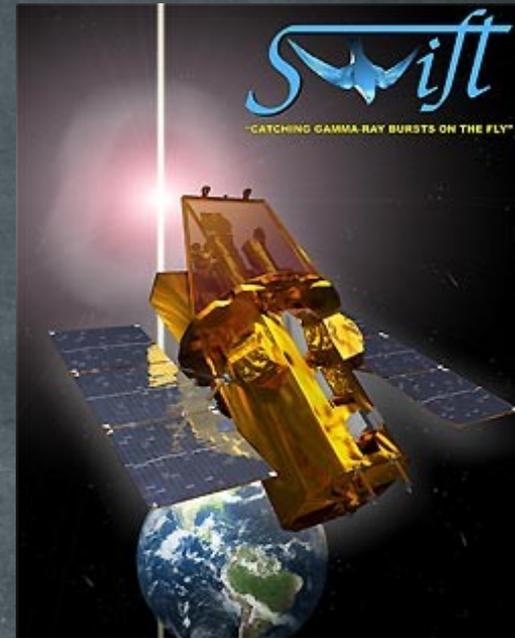

TALK OUTLINE

- Hadronic Models: key ideas and processes
- MW fits and simulated variability of blazars
- Proton supercriticalities: application to GRBs

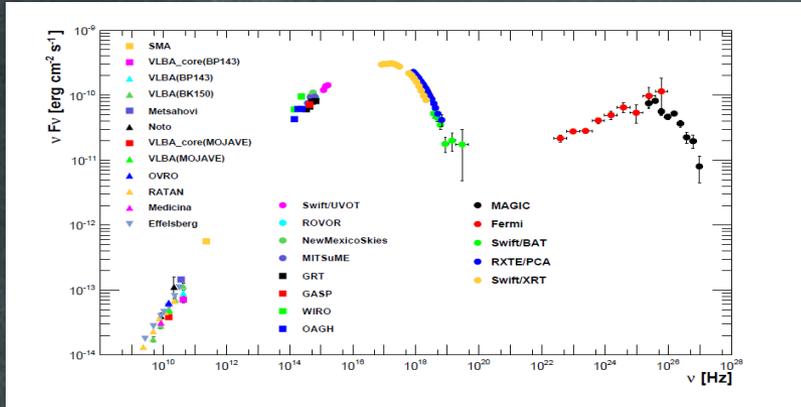

In collaboration with

- Maria Petropoulou
- Stavros Dimitrakoudis
and
- Georgios Vasilopoulos
- Dimitrios Giannios

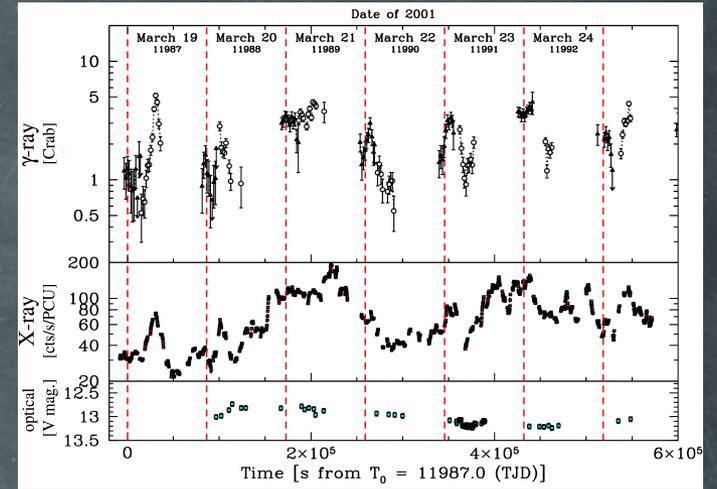

THE MULTI-MESSENGER ERA

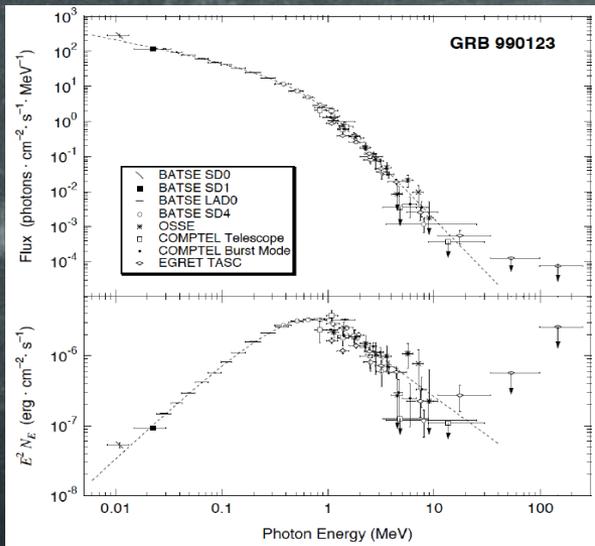

BLAZARS

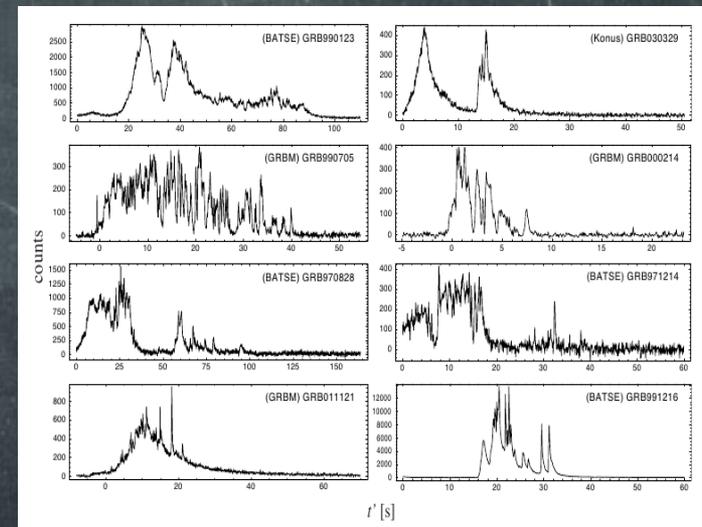

Spectra

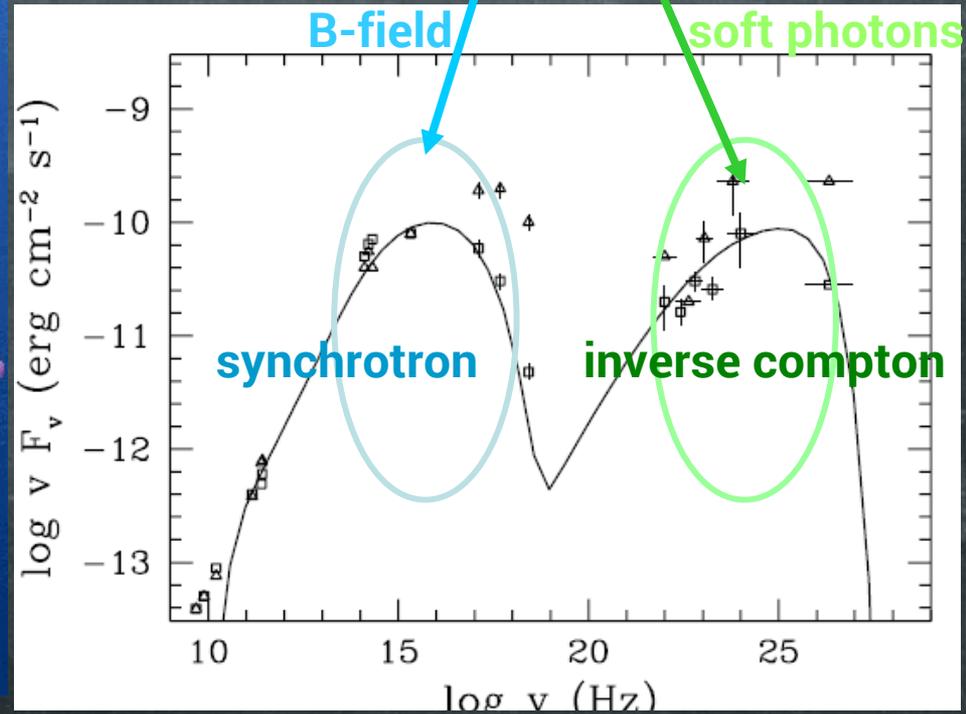

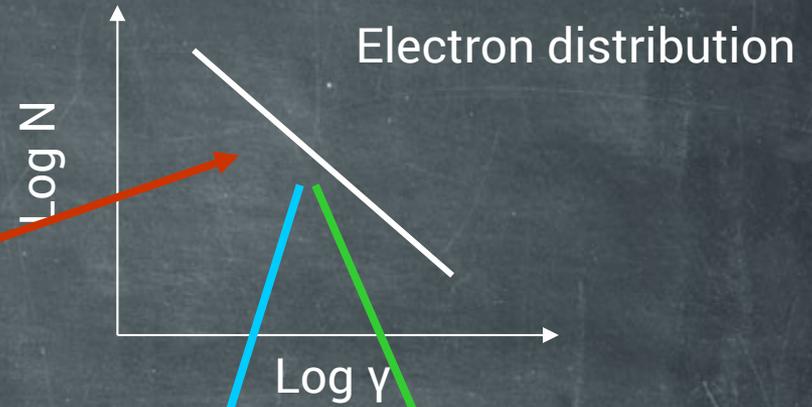

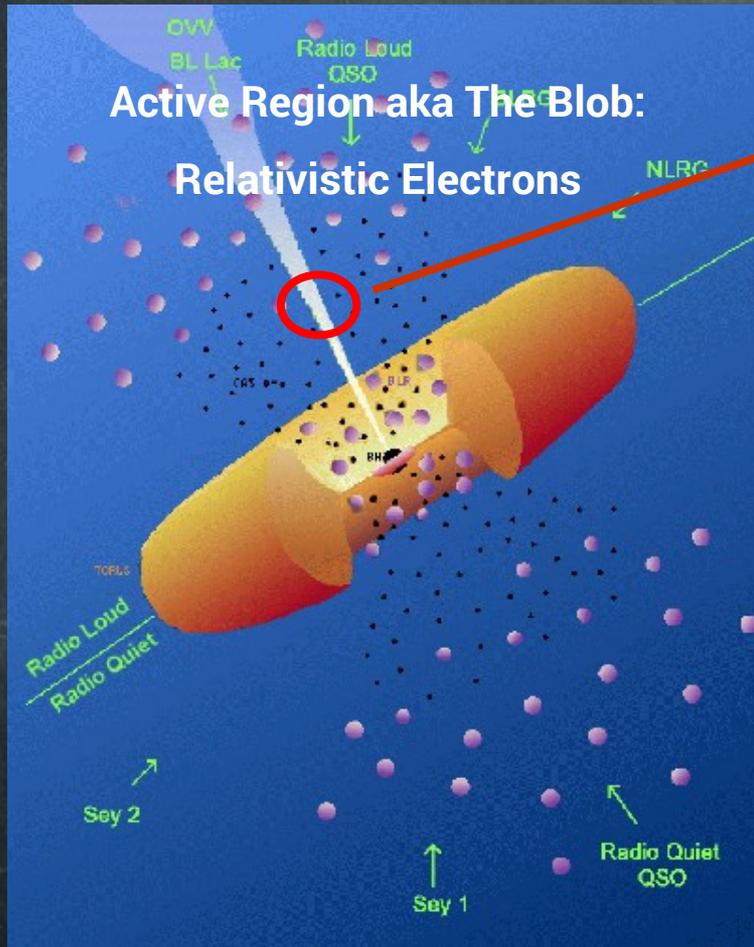

Lightcurves

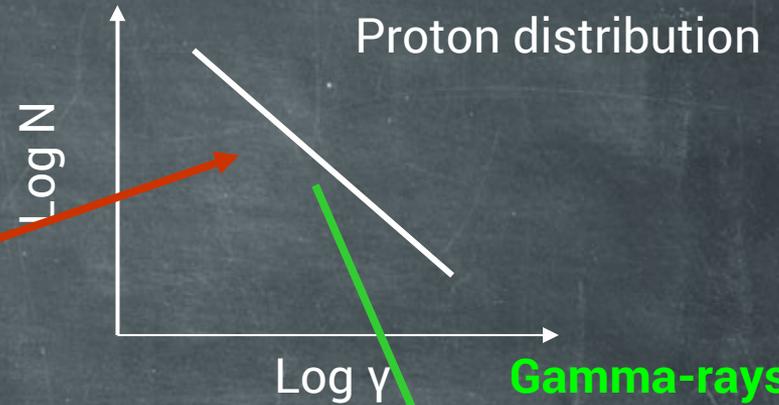

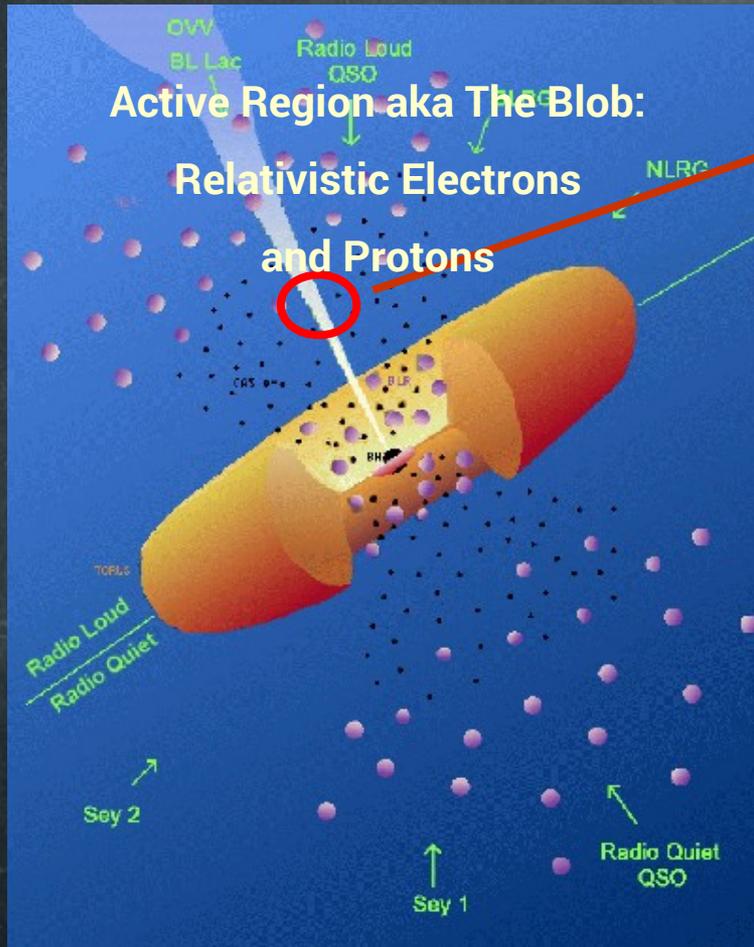

GRBs

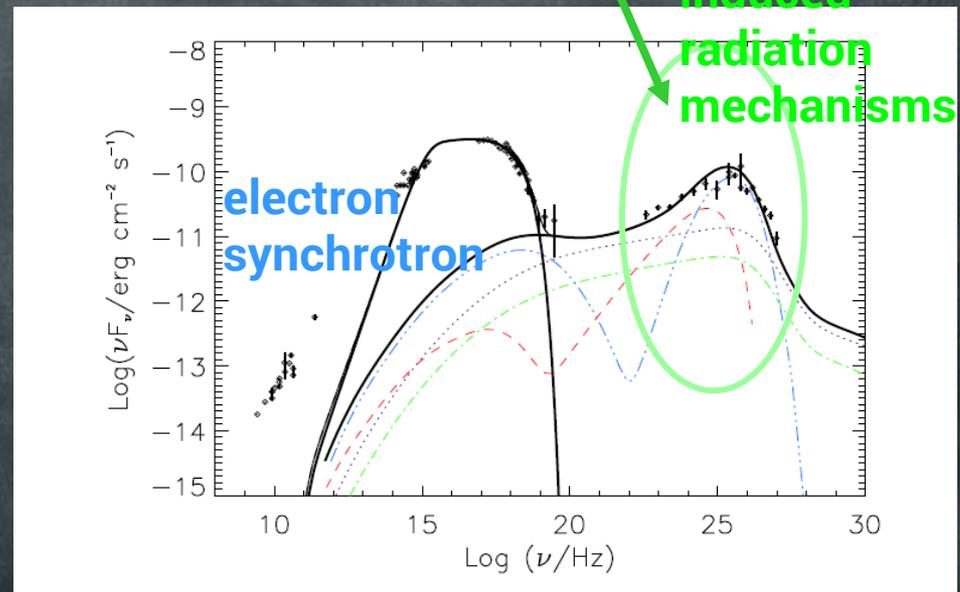

BLAZARS: LEPTONIC MODEL

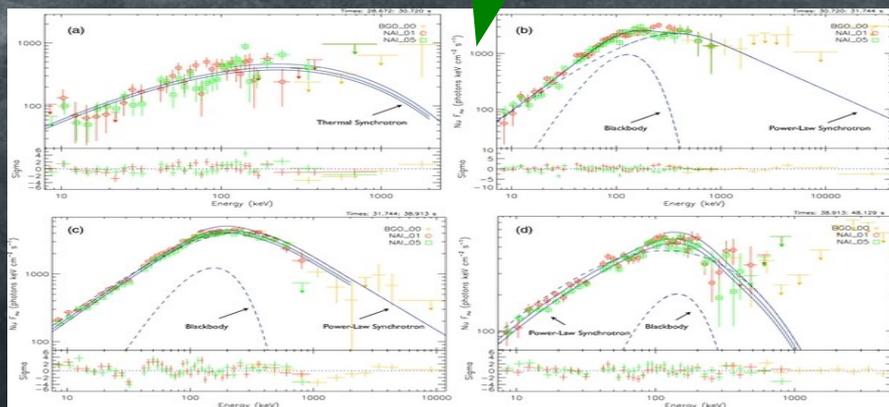

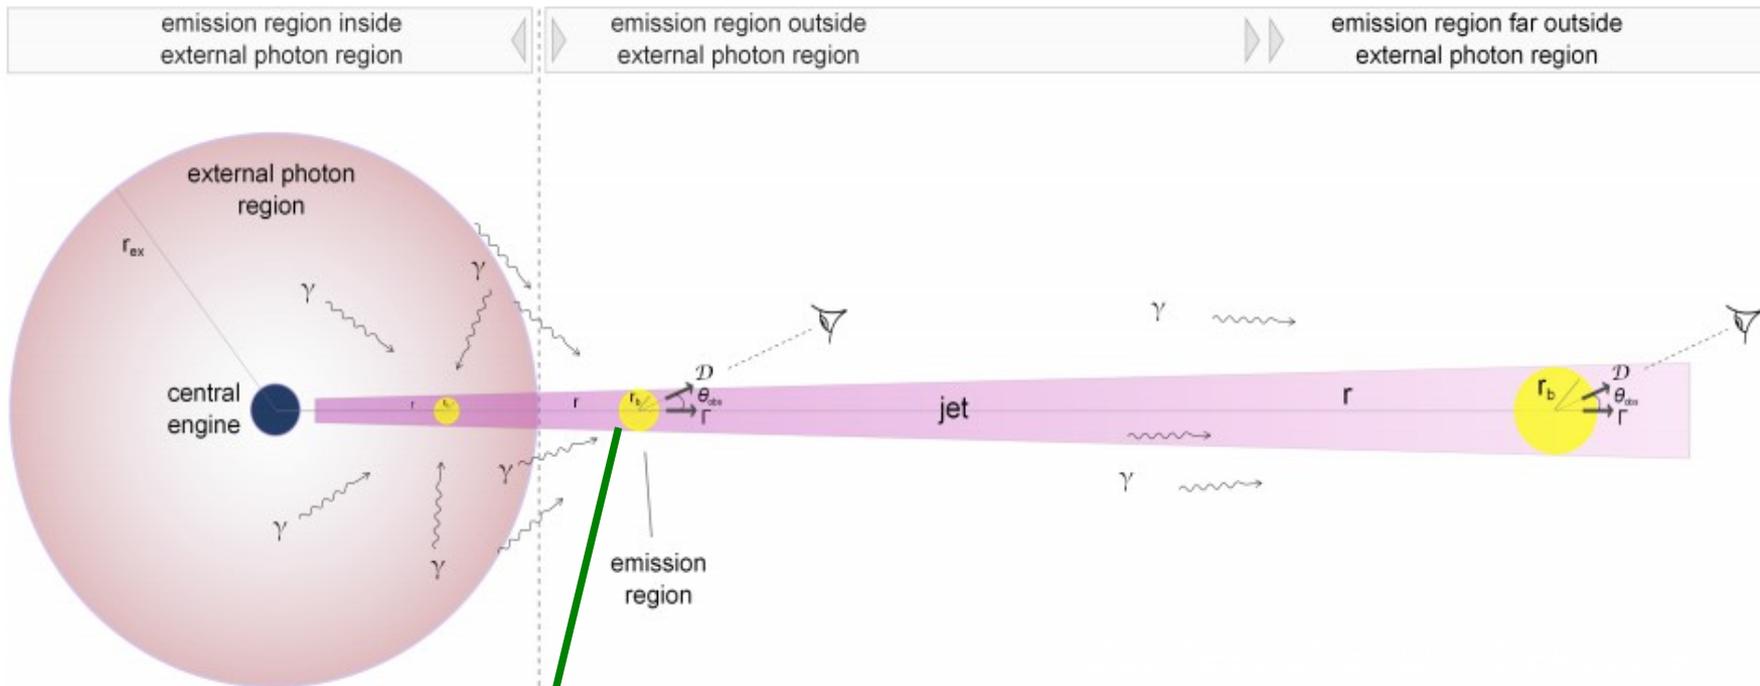

...AND THE HADRONIC MODEL

Gamma-rays
from proton
induced
radiation
mechanisms

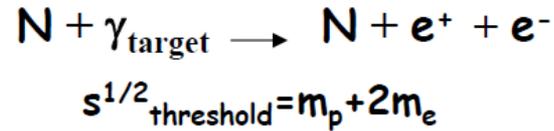

GRBs: LEPTONIC OR HADRONIC

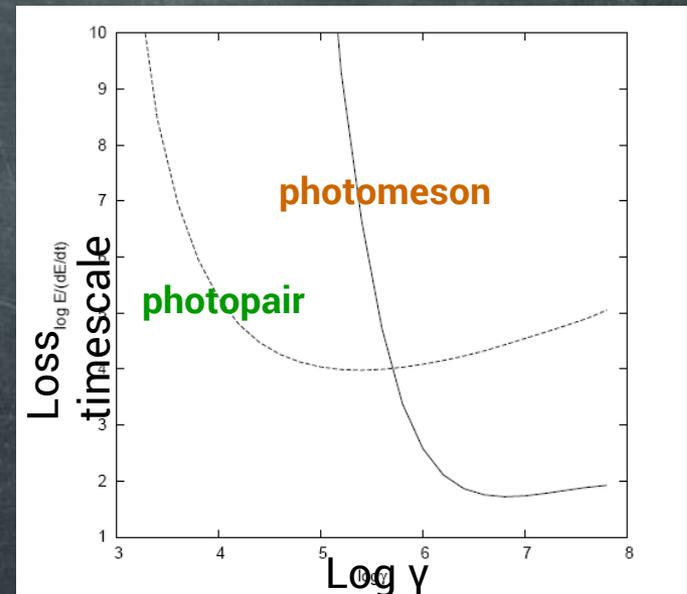

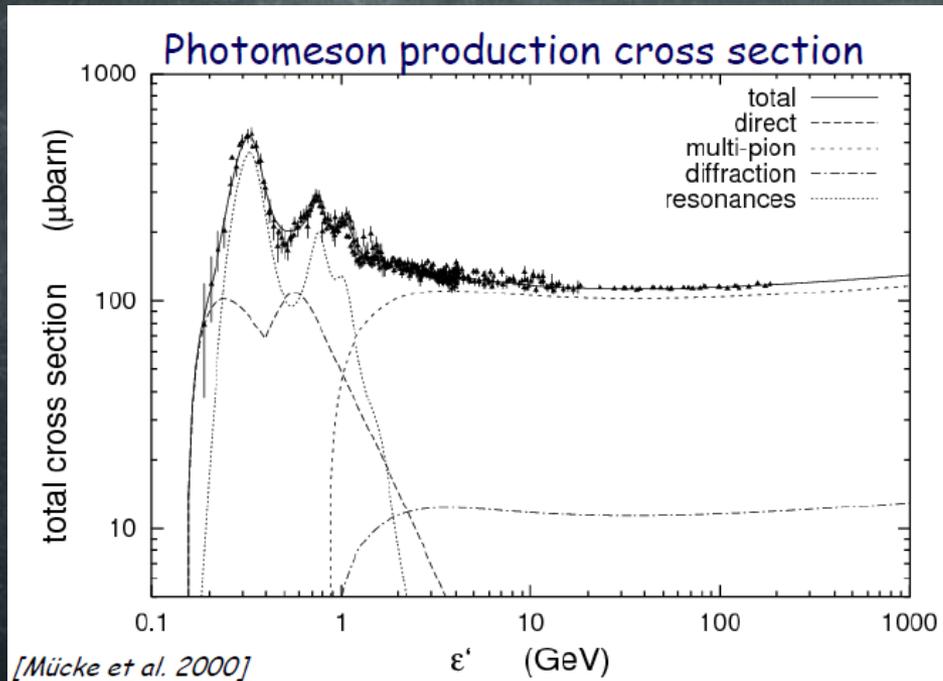

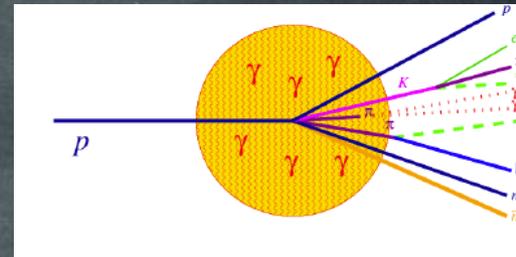

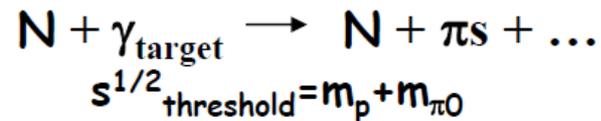

INTERACTION OF NUCLEONS WITH PHOTON FIELDS

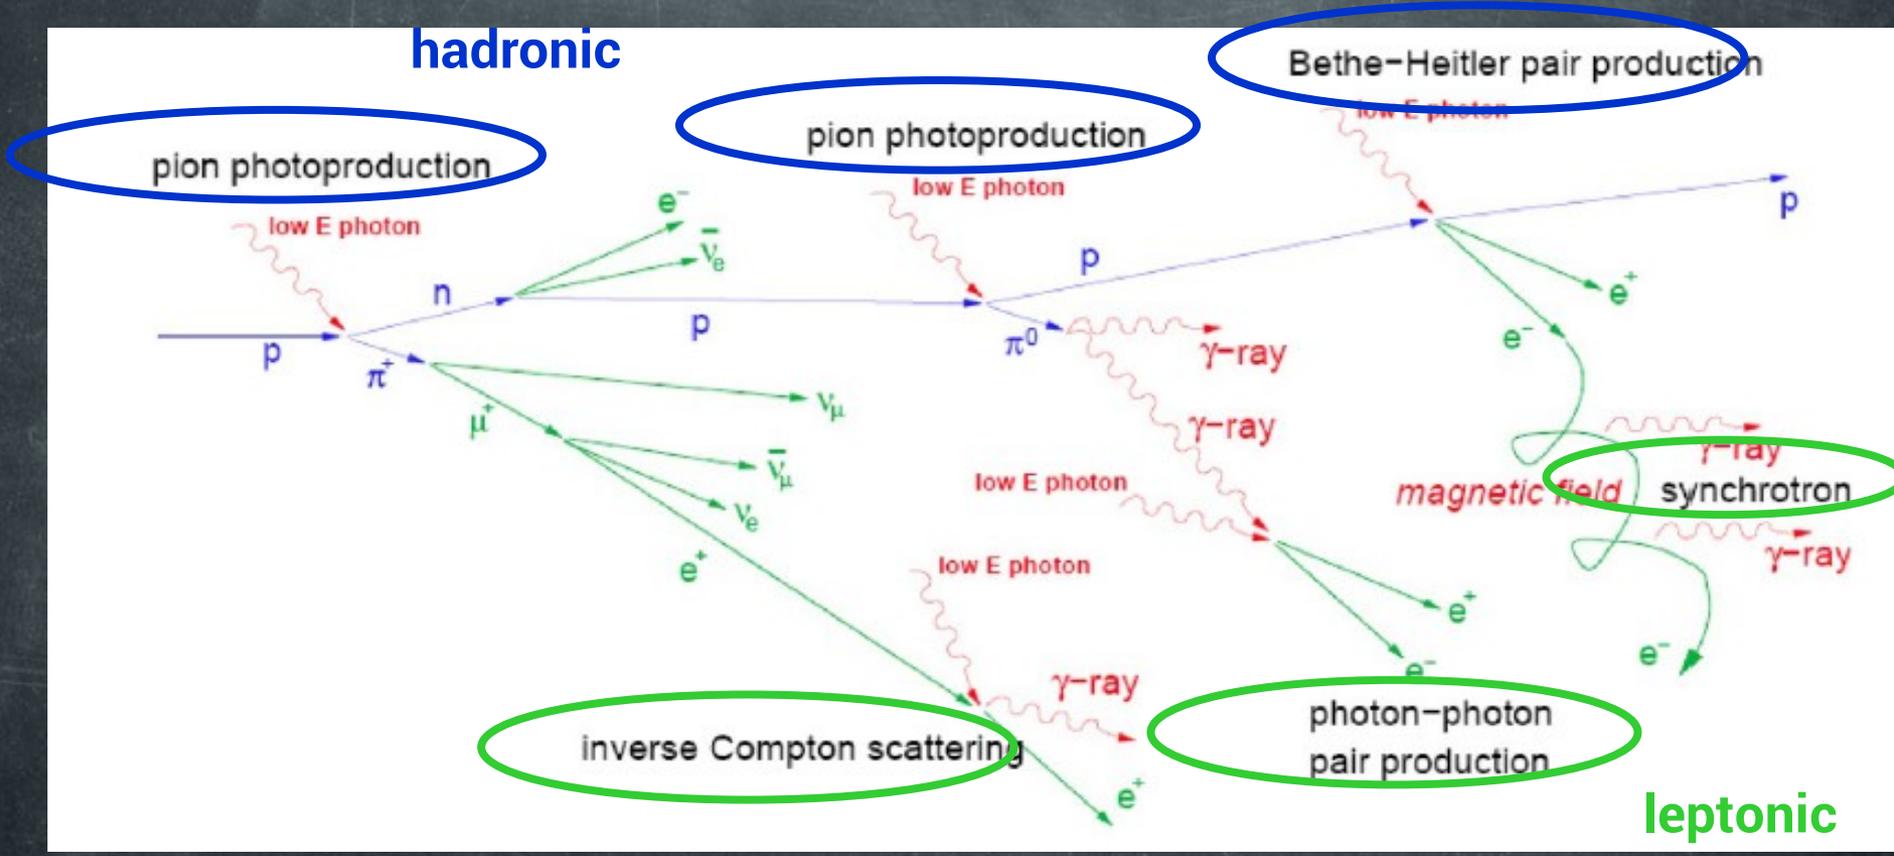

photopair production

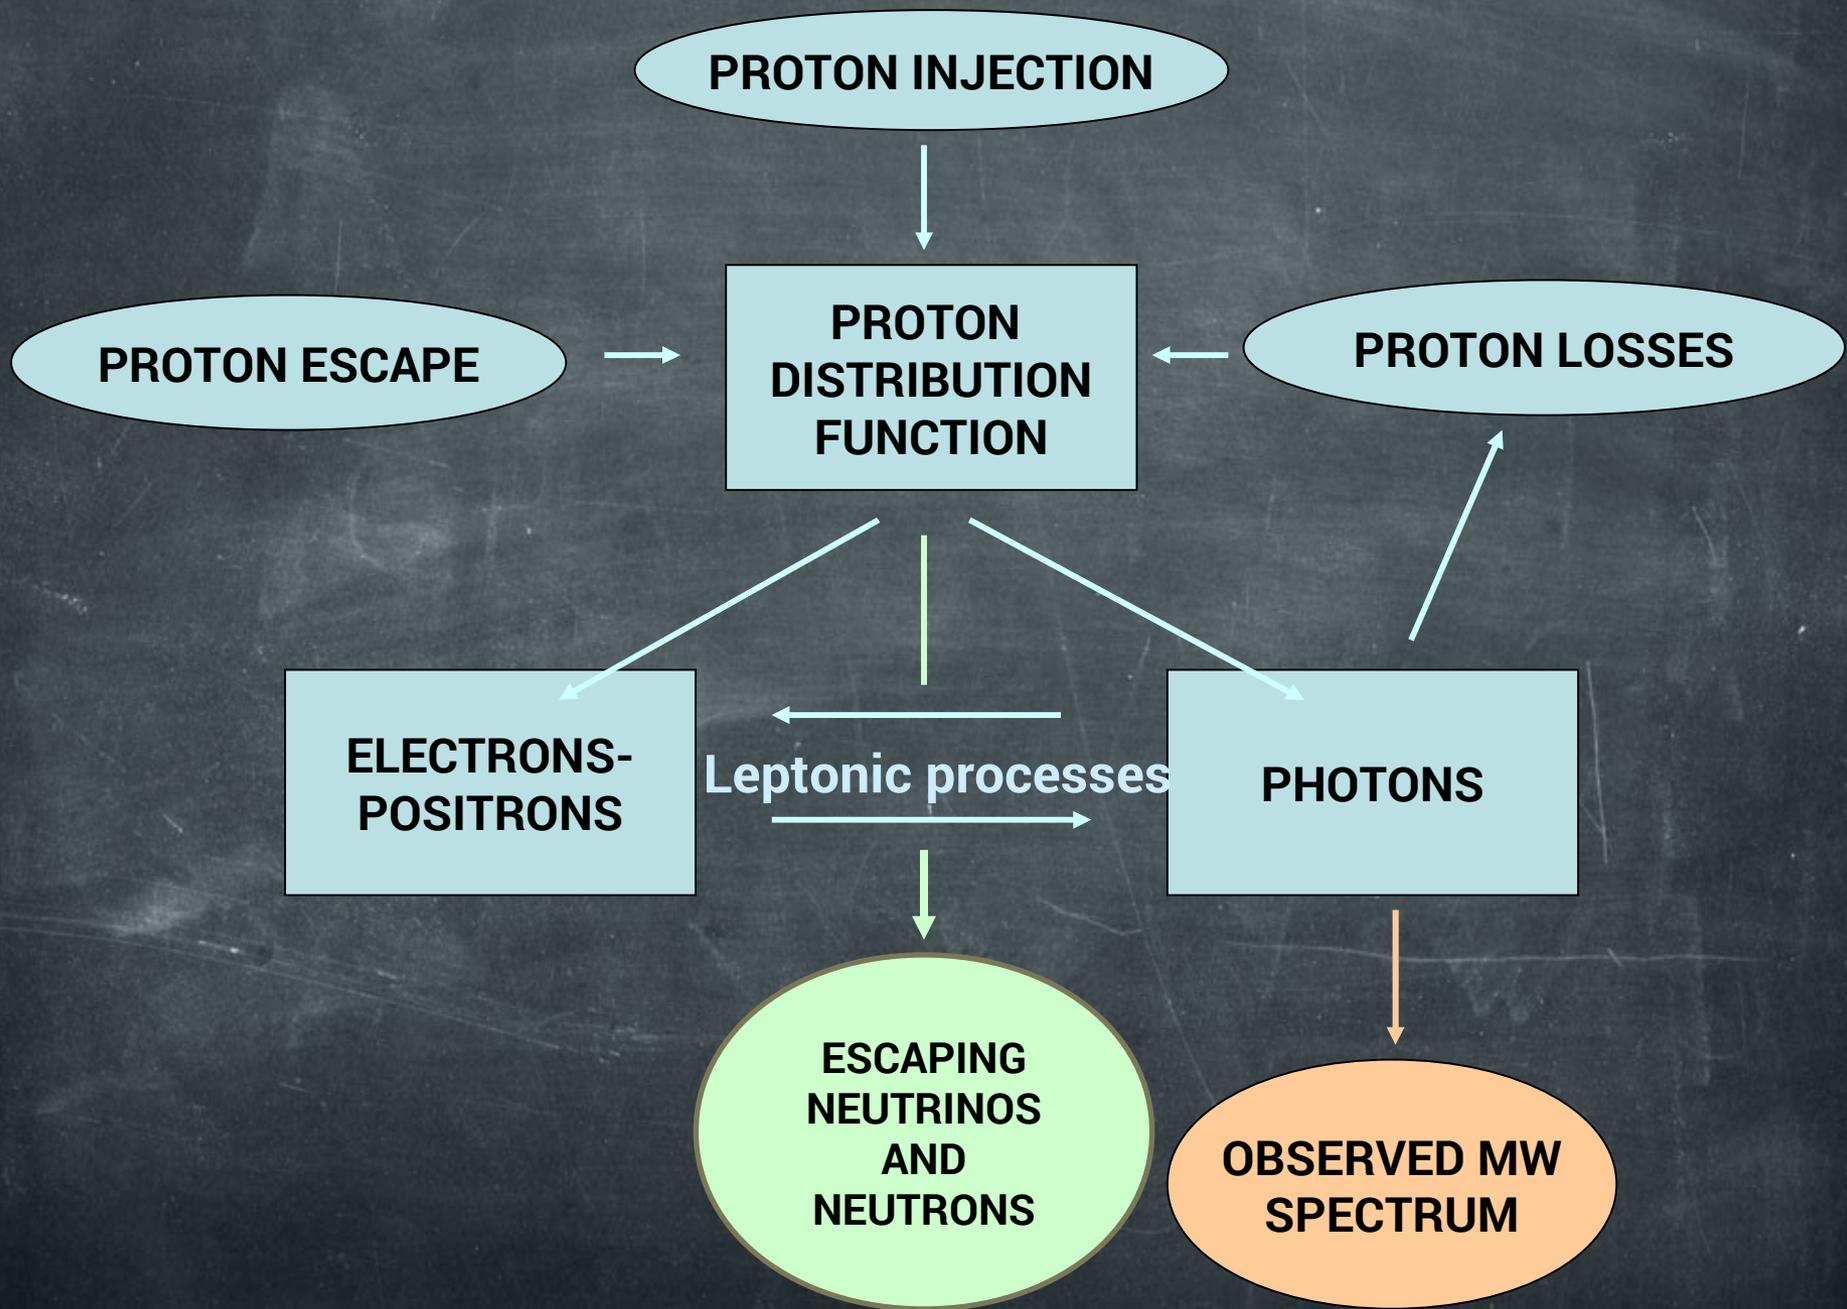

photomeson production

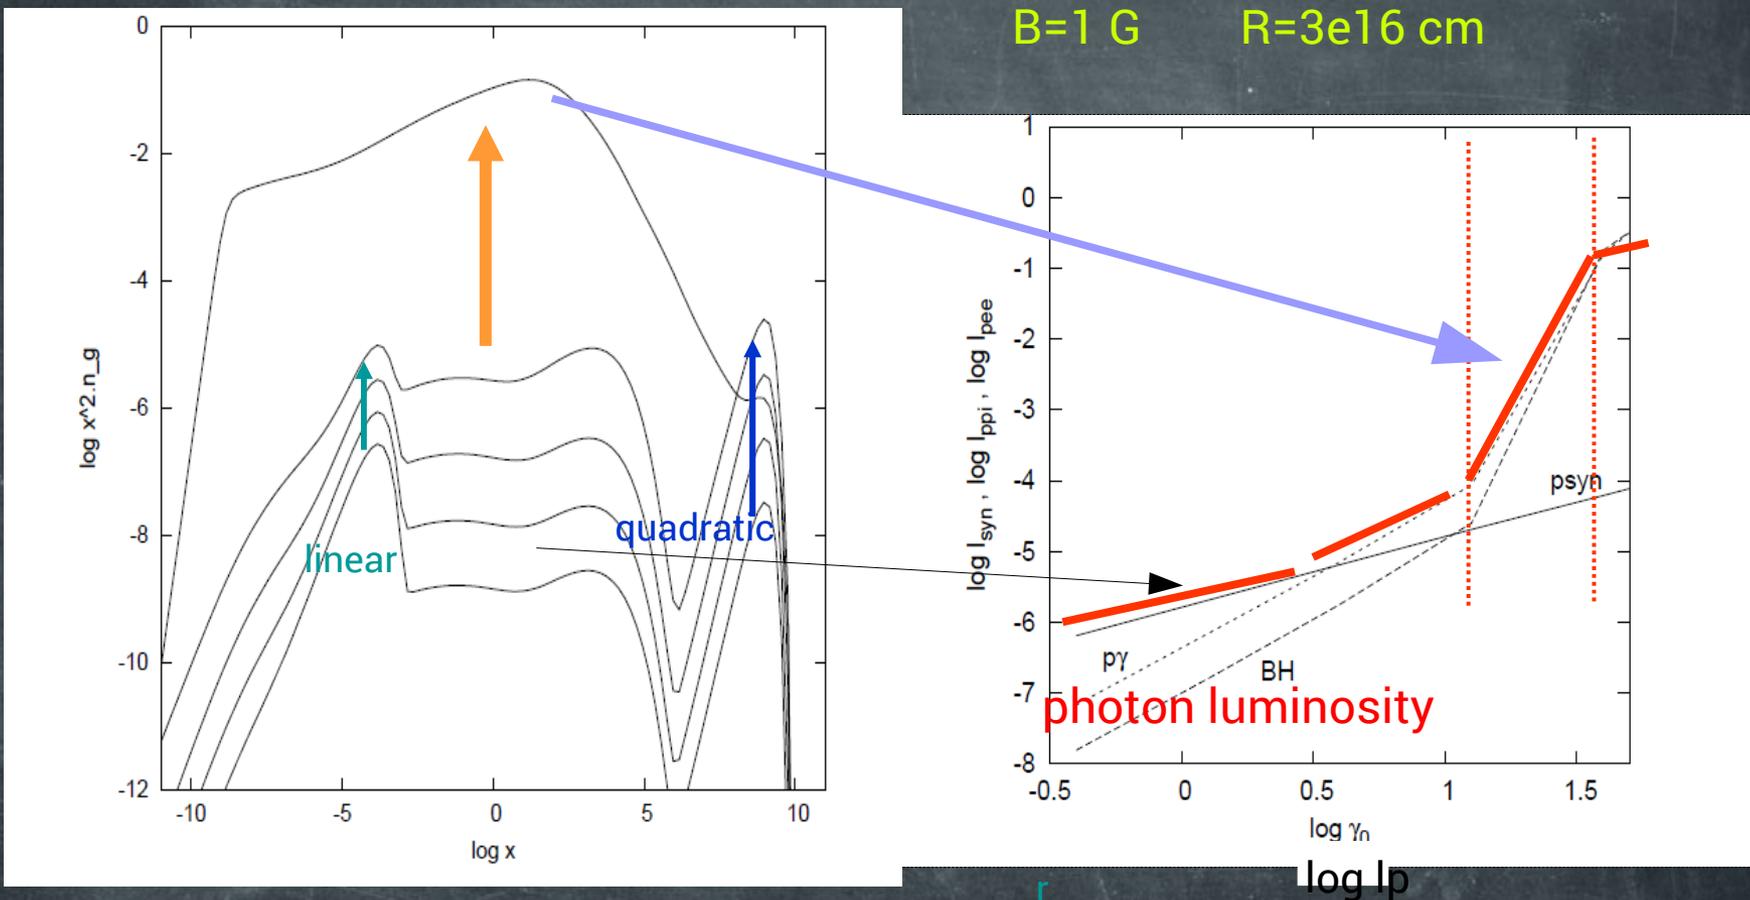

THE HADRONIC MODEL: PHYSICAL PROCESSES

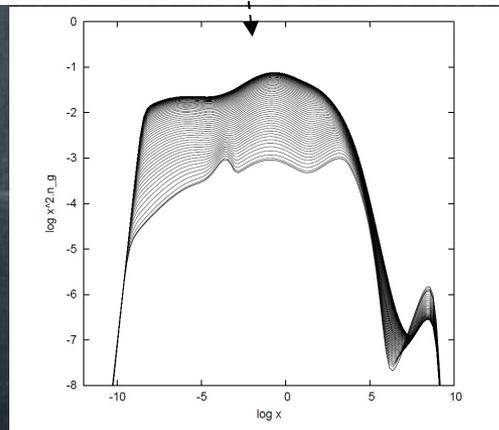

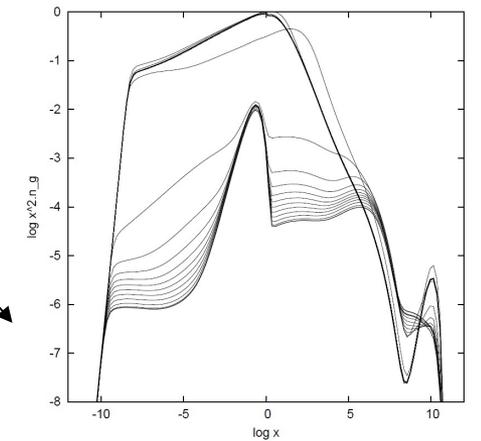

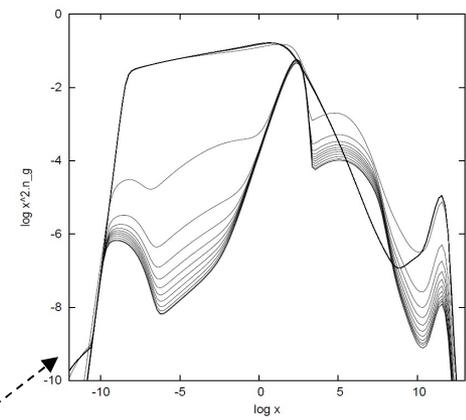

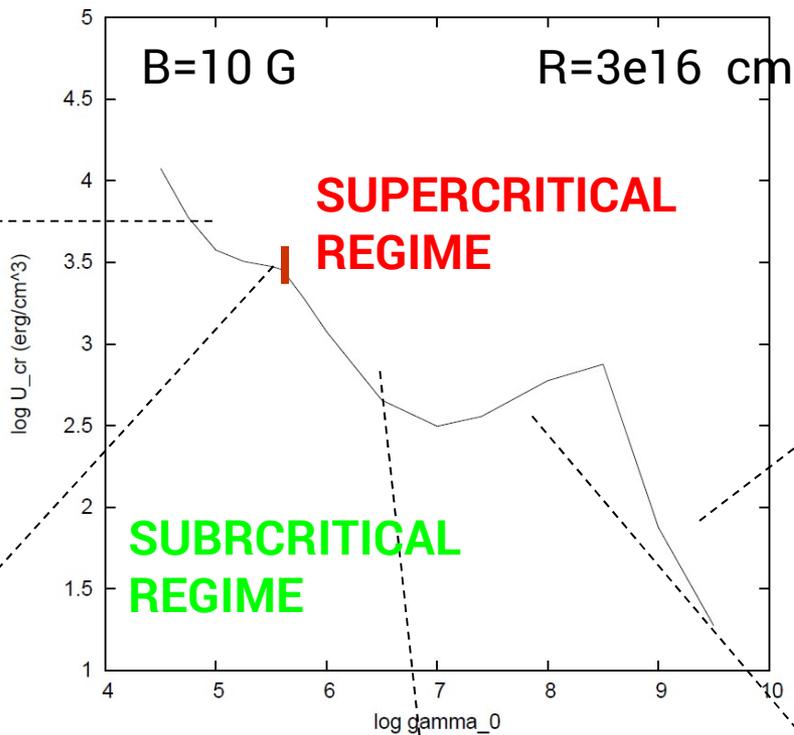

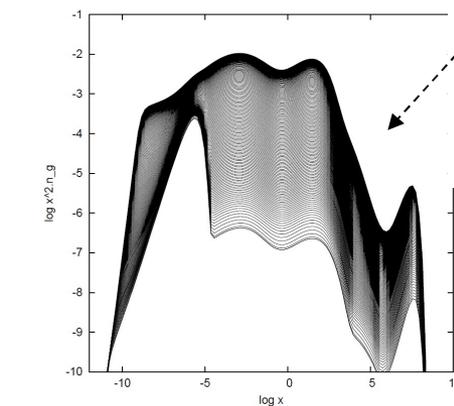

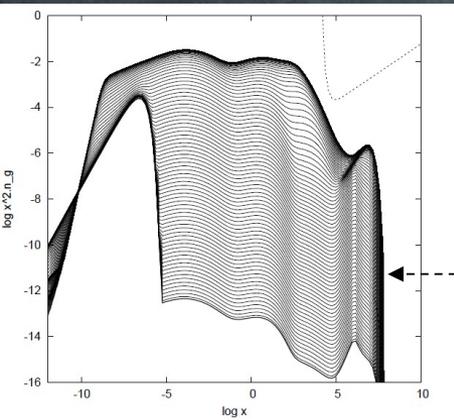

INCREASING THE PROTON INJECTED LUMINOSITY

Proton injected luminosity is increased by a factor 3 -- at some point the system becomes supercritical

THE STEP TO SUPERCRITICALITY

Time-dependent transition of photon spectra from the subcritical to the supercritical regime

In all cases the proton injection luminosity is increased by 1.25 -> corresponding photons increase by several orders of magnitude

A PROTON SUPERCriticalITY 'ZOO'

PROTONS → BETHE-HEITLER PAIRS

Kirk & AM 1992

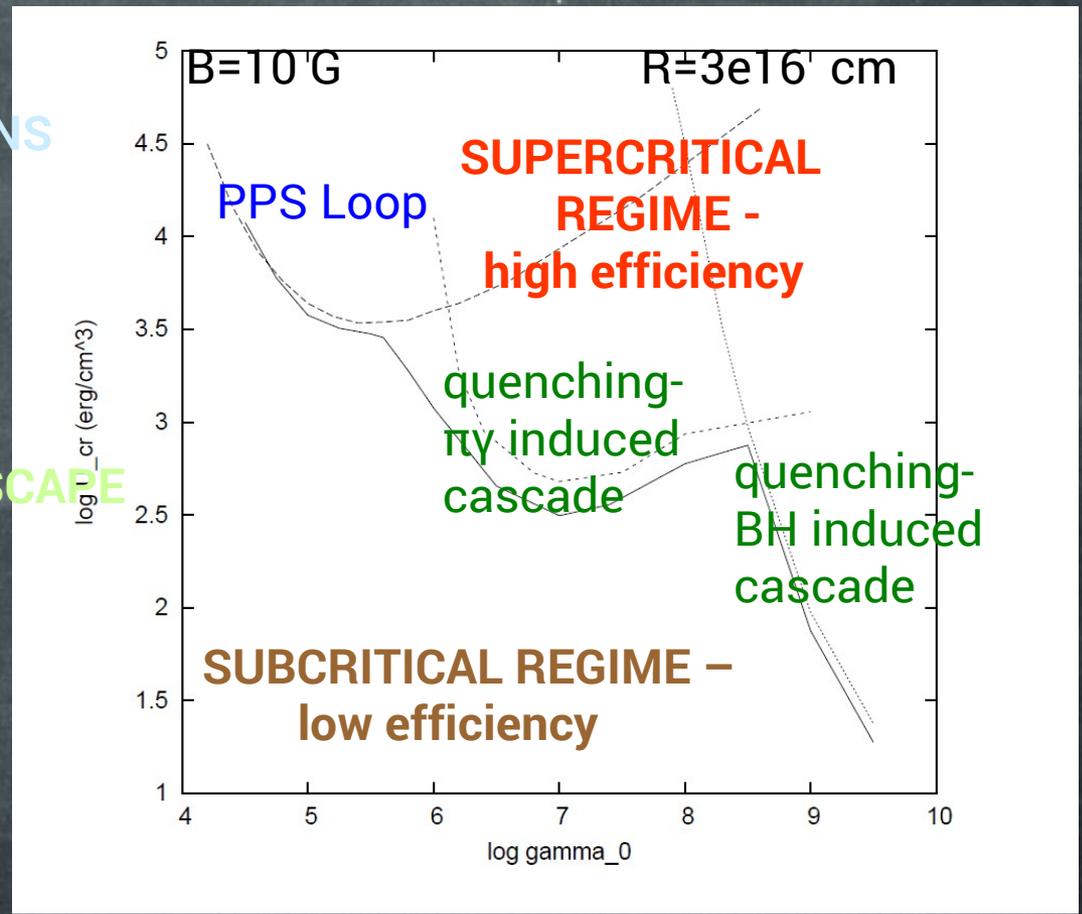

ESCAPE

PROTONS → GAMMA-RAYS → ESCAPE

Stawarz & Kirk 2007
Petropoulou & AM 2012

ESCAPE

Loops are a way of extracting efficiently energy stored in protons

HADRONIC MODELS AS DYNAMICAL SYSTEMS

protons

$$\dot{n}_p = -\frac{n_p}{\tau_p} - \boxed{An_{ex}n_p} - \boxed{Bn_s n_p} + Q_o$$

'hard' photons

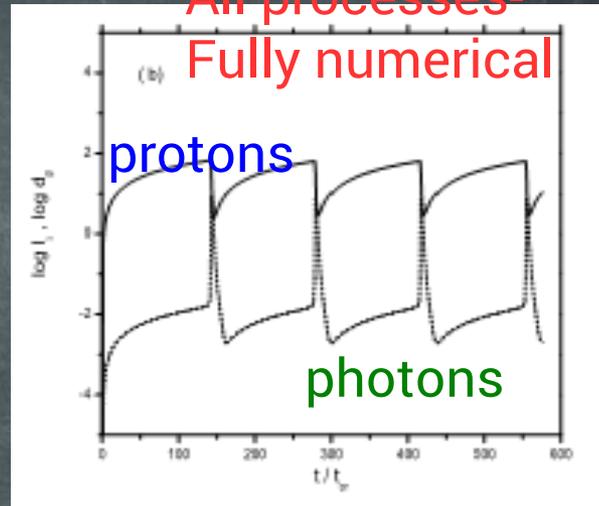

$$\dot{n}_h = -n_h + \boxed{\tilde{A}n_{ex}n_p} + \boxed{\tilde{B}n_s n_p} - \boxed{Cn_s n_h}$$

'soft' photons

$$\dot{n}_s = -n_s + \boxed{\tilde{C}n_s n_h}$$

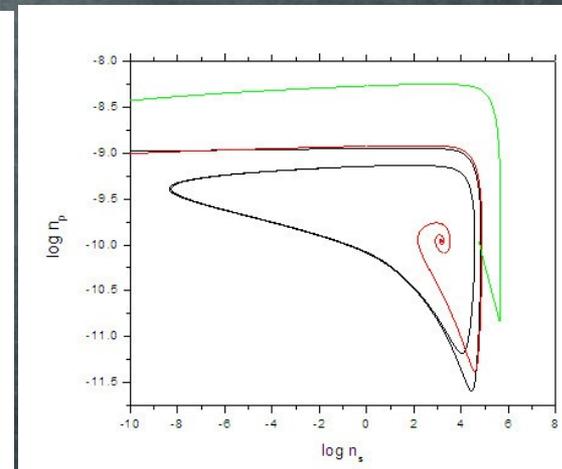

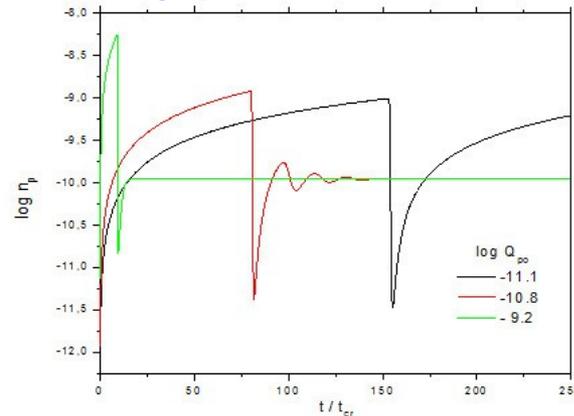

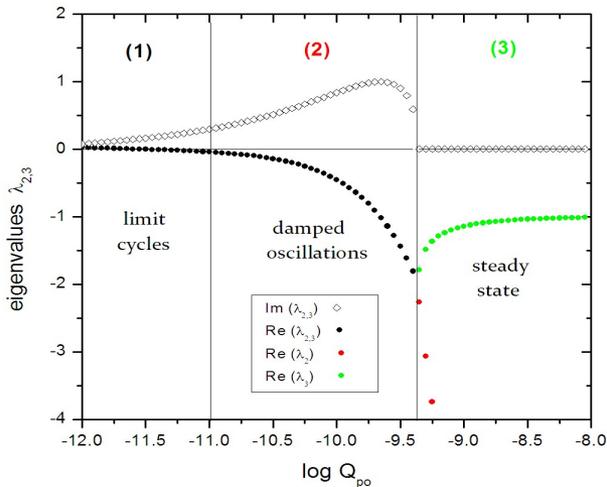

Simplified system
- key processes

All processes-
Fully numerical

protons

photons

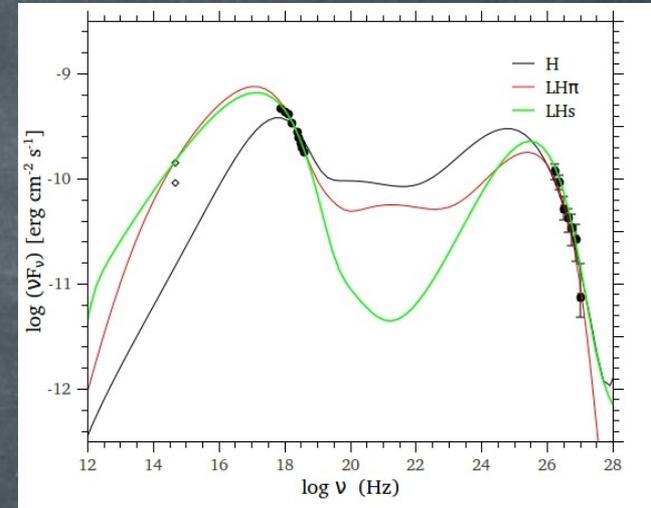

When supercritical, depending on the (constant) proton injection rate, the system goes from limit cycle behavior to damped oscillations to steady state

HADRONIC MODELS: SPECTRAL SIGNATURES

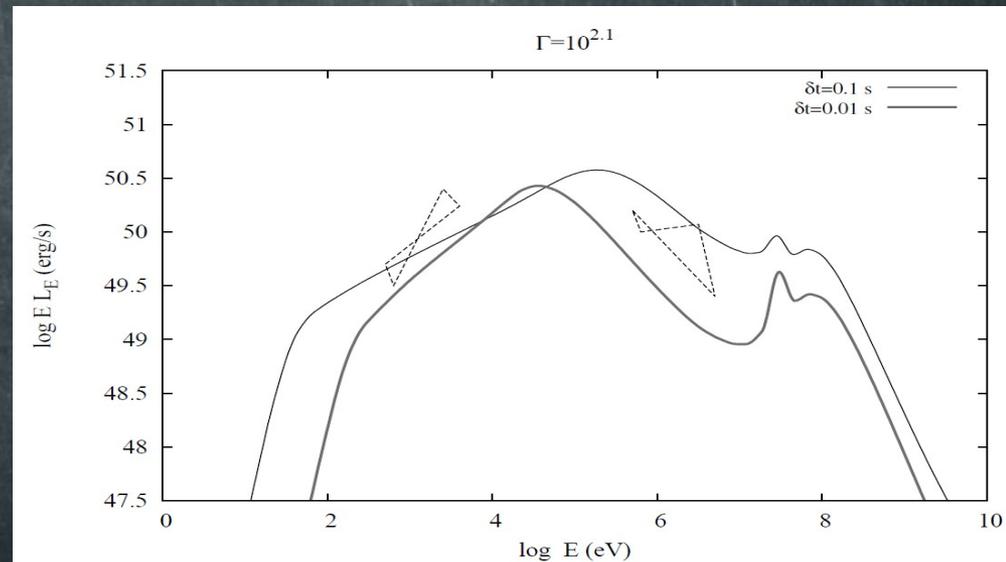

When system subcritical
→ Blazars

AM, M. Petropoulou, S. Dimitrakoudis 2013

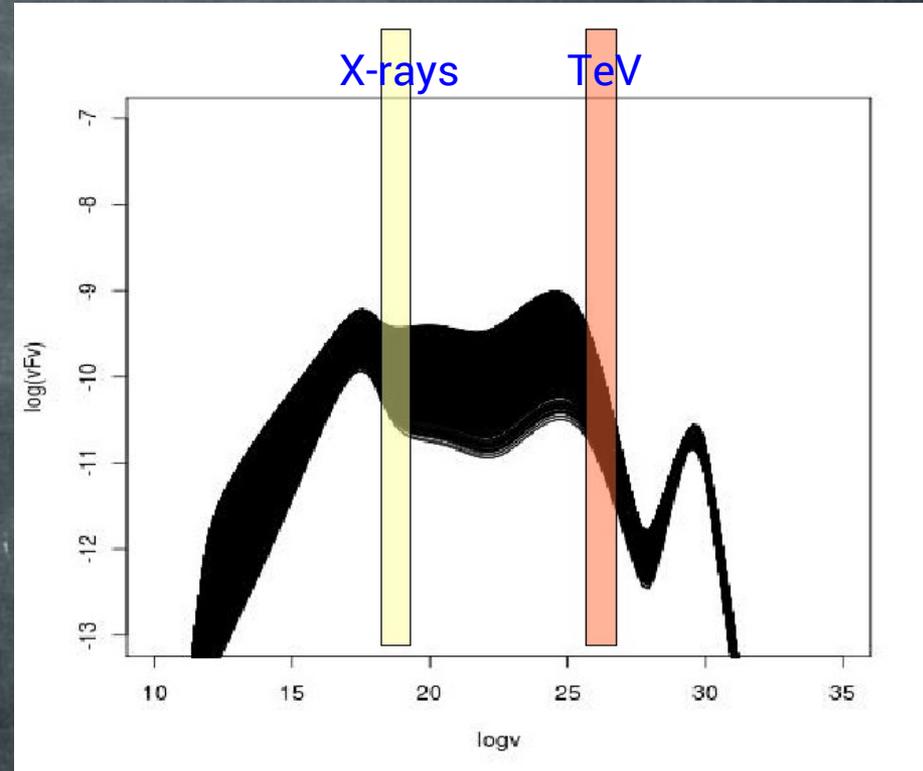

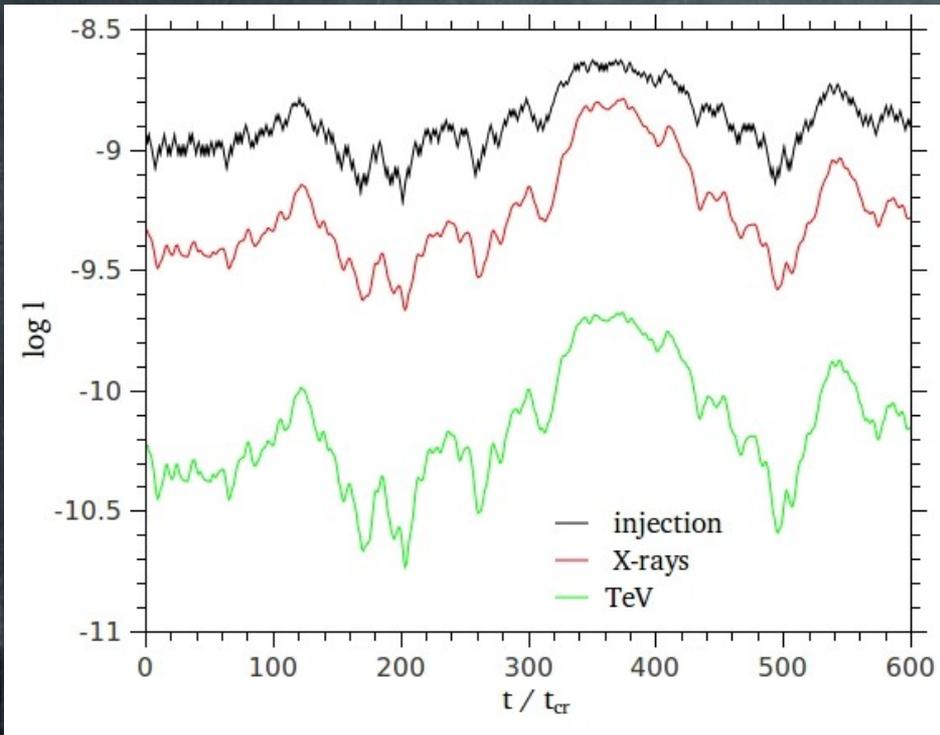

When system
supercritical →
GRBs

*M. Petropoulou, S. Dimitrakoudis, AM,
D. Giannios 2013*

VARIABILITY IN THE SUBCRITICAL REGIME

Assume small amplitude random-walk variations in proton and electron injection

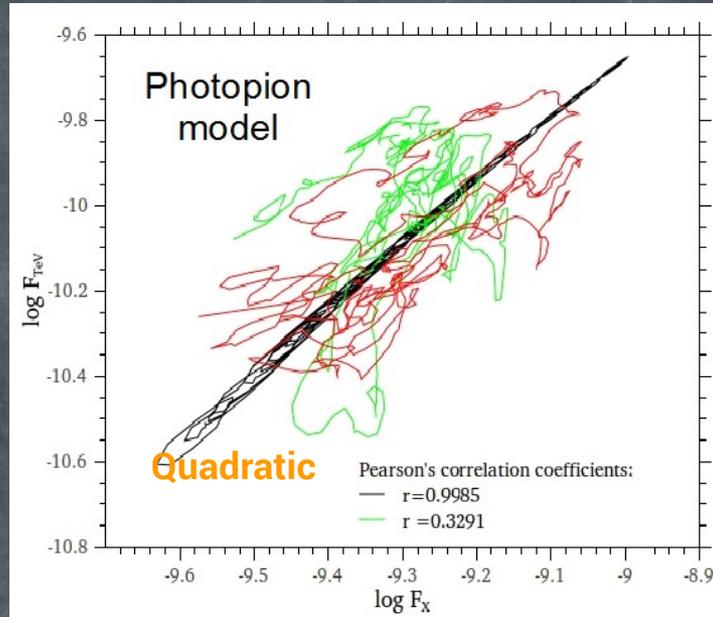

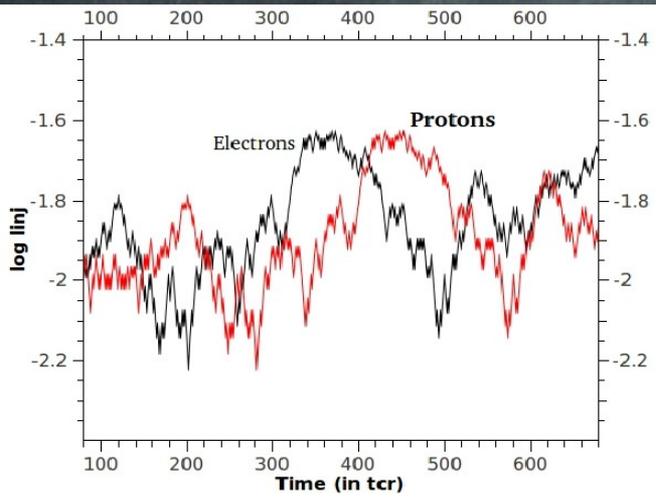

Injection and spectra when p and e totally correlated

SUBCRITICAL (AGN) REGIME

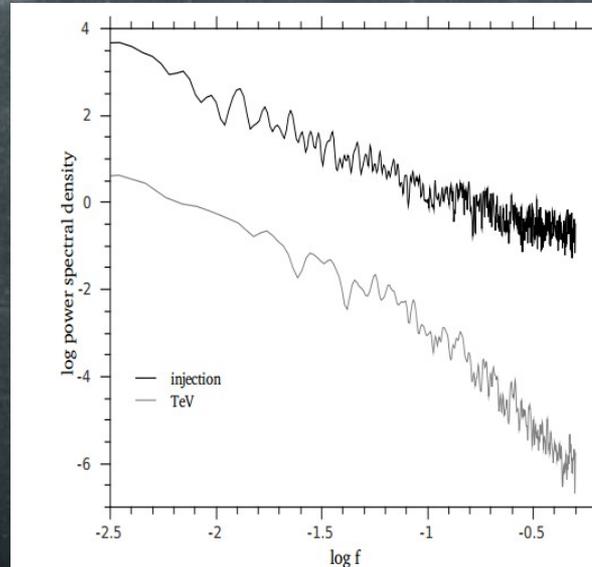

Correlated: no time lag

Correlated: time lag of $80 \tau_{cr}$

Uncorrelated

When electrons-protons are correlated, TeV (hadronic) and X-rays (leptonic) vary quadratically
 Even when electrons-protons totally uncorrelated, X and TeV retain some correlation

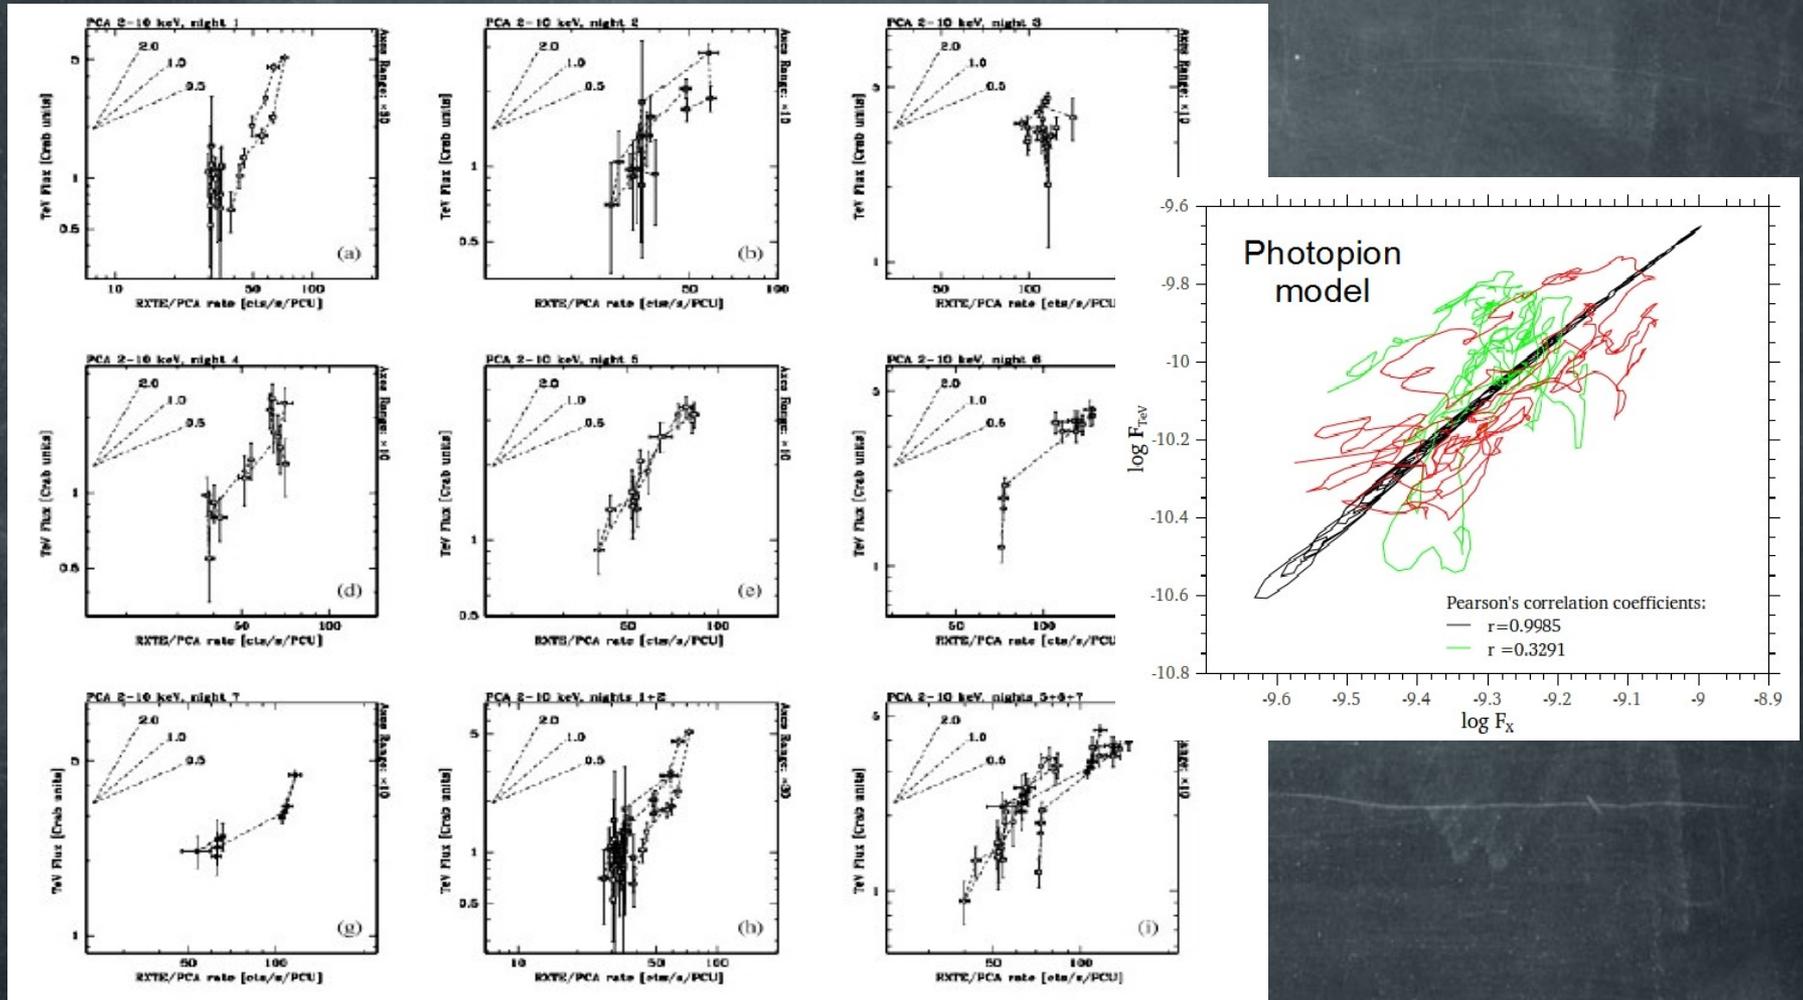

Power-spectra

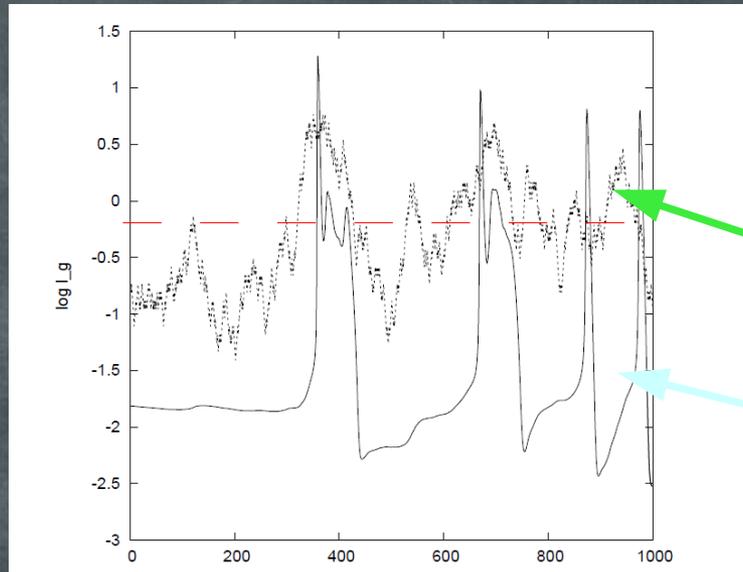

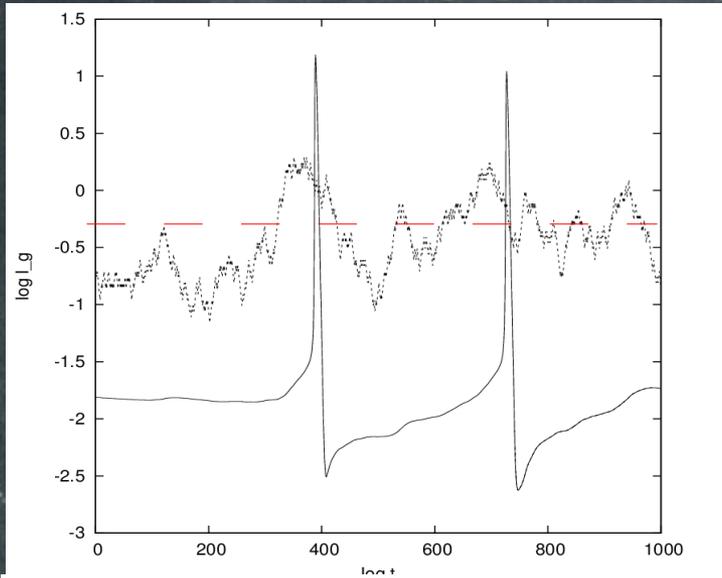

PROTONS (input)

PHOTONS (output)

BLAZAR Mrk 421: X-TeV CORRELATIONS

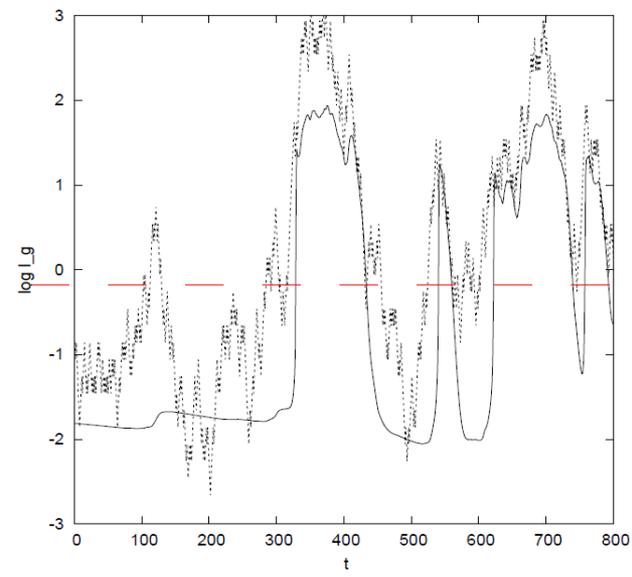

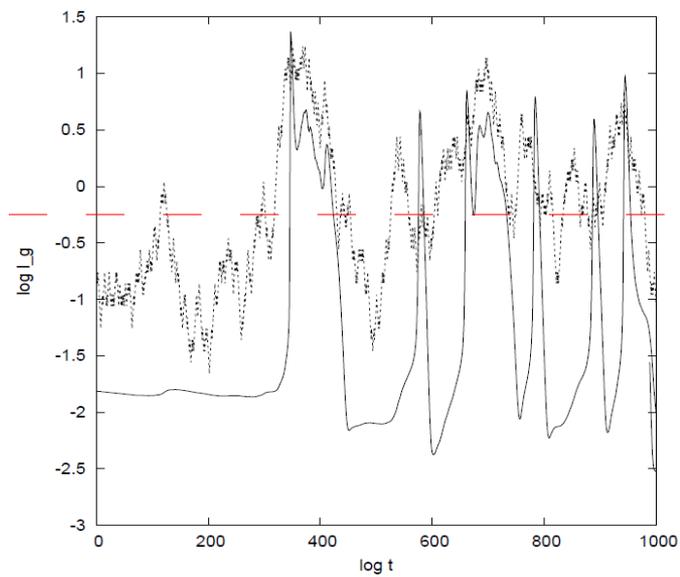

VARIABILITY IN SUPERCRITICAL REGIME

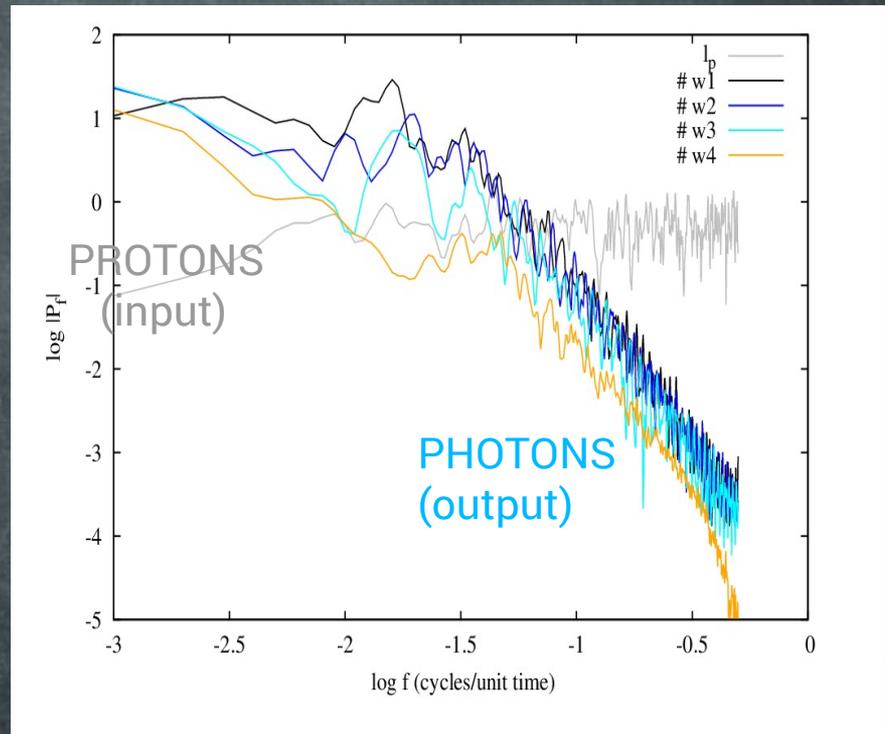

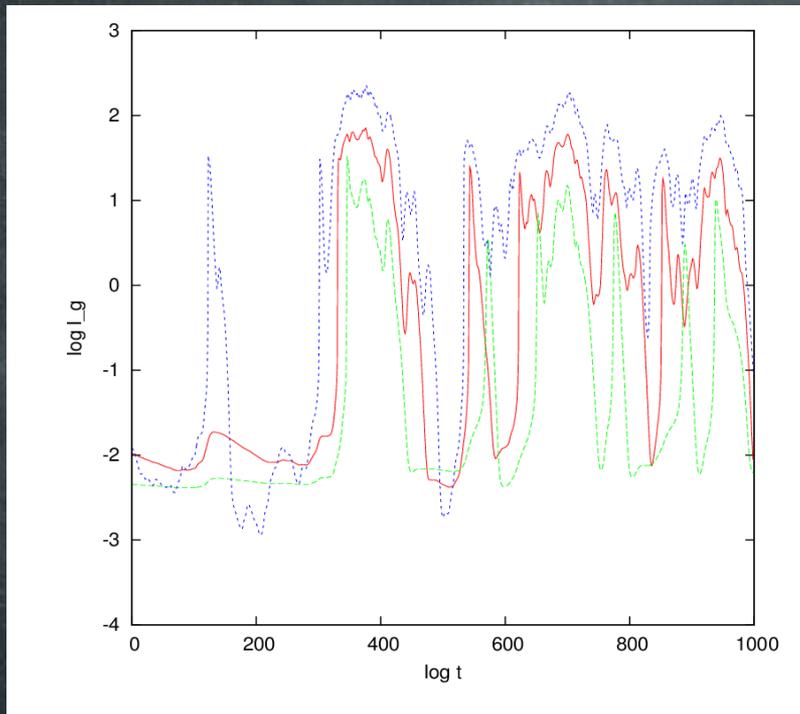

protons

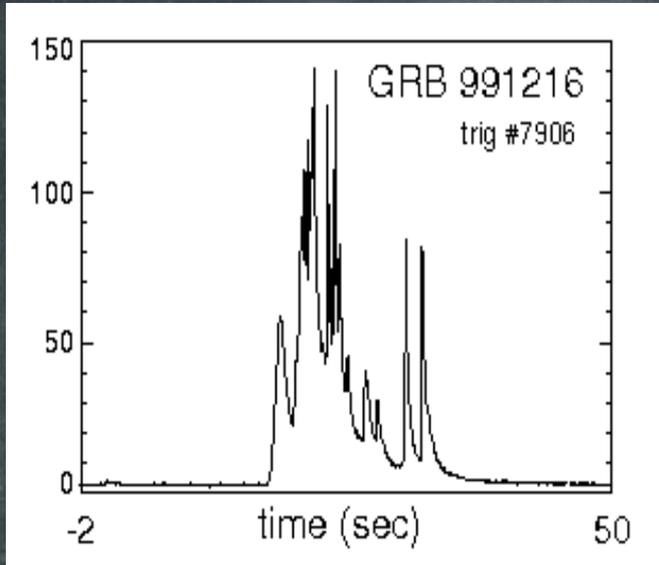

photons

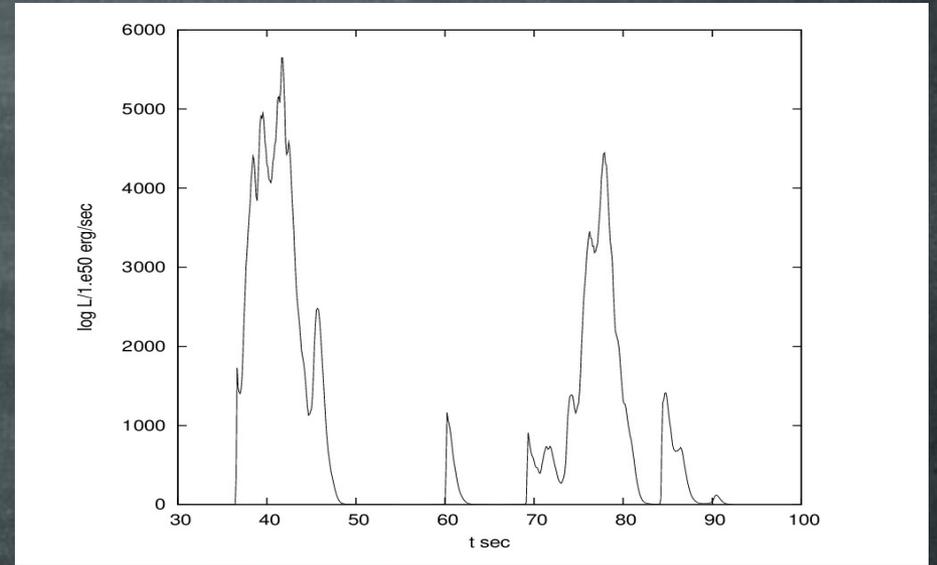

SUPERCRITICAL VARIABILITY: POWER-SPECTRA

COMPARING...

Observed GRB lightcurves

Synthetic lightcurves

CONCLUSIONS

- One-zone hadronic model
 - Accurate secondary injection (photopion + Bethe Heitler)
 - Time dependent - energy conserving PDE scheme
- Two modes:
- **Subcritical (linear) regime**
 - Spectrum: fits to blazar spectra (X-rays from electron synchrotron – γ -rays from secondary pion cascades)
 - Variability: TeV – X-rays quadratic – as (mostly) observed in blazars
- **Supercritical (nonlinear) regime**
 - Spectrum: Optically thick ($\tau \gg 1$) emission – large proton energy content turned into radiation
 - Variability: Burst-type of behavior if proton injection close to the threshold for supercriticality
 - Can these be a basis for a viable hadronic GRB model?
